A community association in Calgary needed a practical and energy efficient storage building to support their recreation facilities and programs. They looked to ZS2 Technologies' TechPanel's for a durable building envelope that could be built rapidly, and lower their operating costs for the long term — especially in the cold Canadian climate.

Construction started in the fall, and thanks to a rapid build time, it was ready for the winter season. The storage building now houses equipment for the skating rink including rink flooding and resurfacing equipment, along with tennis court offices, a tournament room and other storage spaces. All with an estimated 50% energy savings for the community association.
